The technical information is provided to

- inform you about protective measures against corrosion
- help you finding the suitable products for your application
- inform you about available, castum-made products.

In order to make the use of this catalogue easier for you we use tokens and symbols. You find the explanations on the inner pocket of the back side page. If you should have any technical questions or requests about available non-standard products we are glad to help you from our headquarters in Berlin or our branch offices at any time.

Subject to technical modifications.

Corrosion prevention

Prior to choosing materials for the passing of cables it is recommended to take a look at the corrosive environmental conditions at the construction site and to determine the corrosion prevention accordingly.

For installations in regular environment, zinc coatings have proven to be protective for steel against corrosion. However, the protective zinc coat is being reduced by various climatic influences throughout the years. The following table shows the loss of coating per year:

Environmental influence and corrosion risk

Corrosion-category	Loss of thickness µm/year	Typical environment	
		outdoors	indoors
C1 inconsiderable	≥ 0.1	-	Heated buildings like offices, stores, schools, hotels
C2 slight	> 0.1 until 0.7	Little pollution, like rural areas	Not heated buildings with formation of condensate like store houses
C3 moderate	> 0.7 until 2.1	City and industrial environments with moderate pollution	Production plants with high humidity, like laundry, brewery and dairy
C4 strong	> 2.1 until 4.2	Industrial areas and coastlines with moderate salt impact	Chemical plants, swimming pools
C5-I very strong (industrial)	> 4.2 until 8.2	Industrial environment with high humidity and aggressive atmosphere	Buildings or areas with almost permanent condensation and pollution
C5-M very strong (ocean)	> 4.2 until 8.2	Coastlines and offshore areas with high salt impact	Buildings or areas with almost permanent condensation and pollution

(Source: EN ISO 12944-2)

The loss of thickness per year multiplied with the expected life span of the construction determines the necessary thickness of zinc coating. There are mainly three zinc coatings that differ in thickness of coating, adhesive strength and appearance.

Galvanic zinc (EN ISO 4042)

The small parts are zinced by means of electrolysis bath in which the zinc ions apply very evenly to the metal. The zinc coat is app. 5 µm thick, light glossy, and has an additional protection by succeeding bi chromium conditioning against abrasion.

Nuts and bolts (without further marking) in the catalogue are galvanic zinc coated **GV**. They are used for connecting Sendzimir zinc coated construction elements.

Hot galvanized according to the Sendzimir procedure (EN 10346)

The steel strapping (thickness up to 2 mm) is coated in the steel-mill with zinc (flow path procedure). The result is an evenly spread and highly adhesive zinc coat with an average thickness of 19 µm.

Damage to the zinc coat caused by cutting, punching or drilling does not result in progressing corrosion because the neighbouring zinc is dissolving under the impact of (air-) humidity and builds a protective, brown coating layer of zinc hydroxide over the blanc metal. The „migration“ of zinc ions protects free areas up until app. 2 mm width. These articles are marked with the symbol **S**.

Hot dip galvanized (EN ISO 1461)

The parts are hot dip galvanized after processing in liquid zinc (app. 450 C). Chemical reactions lead to various zinc-iron alloys, which are especially firmly connected to the steel core. These alloys are usually coated with a „pure zinc layer“. Depending on the speed of the reaction, steel composition, time of dipping, cooling process etc., a „growing through“ to the surface of the zinc-iron alloy is possible as well.

Therefore the appearance of the surface varies from dull dark grey to light glossy. This is no indication of thickness of zinc coating or quality of corrosion prevention. Humid environment can also cause a forming of zinc-hydroxide-carbonate (so called white rust). This does not influence the efficiency of the corrosion prevention. Cutting edges need to be protected with cold zinc paint (see catalogue chapter A).

According to EN ISO 1461 the average local thickness of the coating is at least

- 45 µm for material thicknesses up to 1.5 mm
- 55 µm for material thicknesses from 1.5 up to 3 mm
- 70 µm for material thicknesses from 3 up to 6 mm

The EN ISO 1461 complies basically with

BS EN ISO 1461 in Great Britain

EN ISO 1461 in France

NEN EN 1461 in USA

All types of cable trays and medium- heavy/heavy support systems are deliverable conditional of manifactoring in hot dip galvanized. This program is marked with the symbol **F**.

Stainless steel

Considering the aspects of high corrosion resistance, easily cleanable surface, ability of recycling, and fire resistance, stainless steel becomes increasingly the material of first choice. Especially for the chemical, paper, textile and food industry, in sewages, refineries, car tunnels and in off-shore areas it is being commonly used.

Regarding the long lasting life cycle of such constructions, stainless steel is often times the economically most suitable solution in spite of the higher initial investment. In case of insufficient corrosion resistance the investments are accelerated by business interruption, rearrangement of cable loads, exchange of structural components.

Compared to various plastic materials stainless steel features through high firmness, resistance against fire and heat, as well as the emission free manner in case of fire and mechanical processing.

The commonly used material No.: 1.4301 is marked with the short description X5CrNi 18-10 according to EN 10088-3 and has been approved by the German Institute for Construction Engineering in Berlin under the general admittance Z-30.3-6 for construction processes.

Assignment to recent and outdated norms:

EN 10088-3 1.4301 X5CrNi 18-10

AISI 304

UNS S 30400

BS 304 S31

AFNOR Z7CN 18-09

PUK offers a complete high-grade steel program made of: bracket supports, brackets, cable trays, ladders, vertical ladders, profile rails and cable clamps.

Nuts and bolts comply to steel-group A2 (according to ISO 3506). This is indicated with the symbol **E**.

Corrosion prevention

Technical information

The stainless steel program is available on request in material No. 1.4404 with the short appellation X2CrNiMo 17-12-2 (according to EN 10088-2 and -3) and has been also certified by the German Institute for Construction Engineering in Berlin. Nuts and bolts comply to steel-group A4 (according to ISO 3506).

Assignment to recent and outdated norms:

EN 10088-3	1.4404 X2CrNiMo 17-12-2
AISI	316 L
UNS	S 31603
BS	316 S 11
AFNOR	Z3CND17-11-02
DIN 17440	1.4404

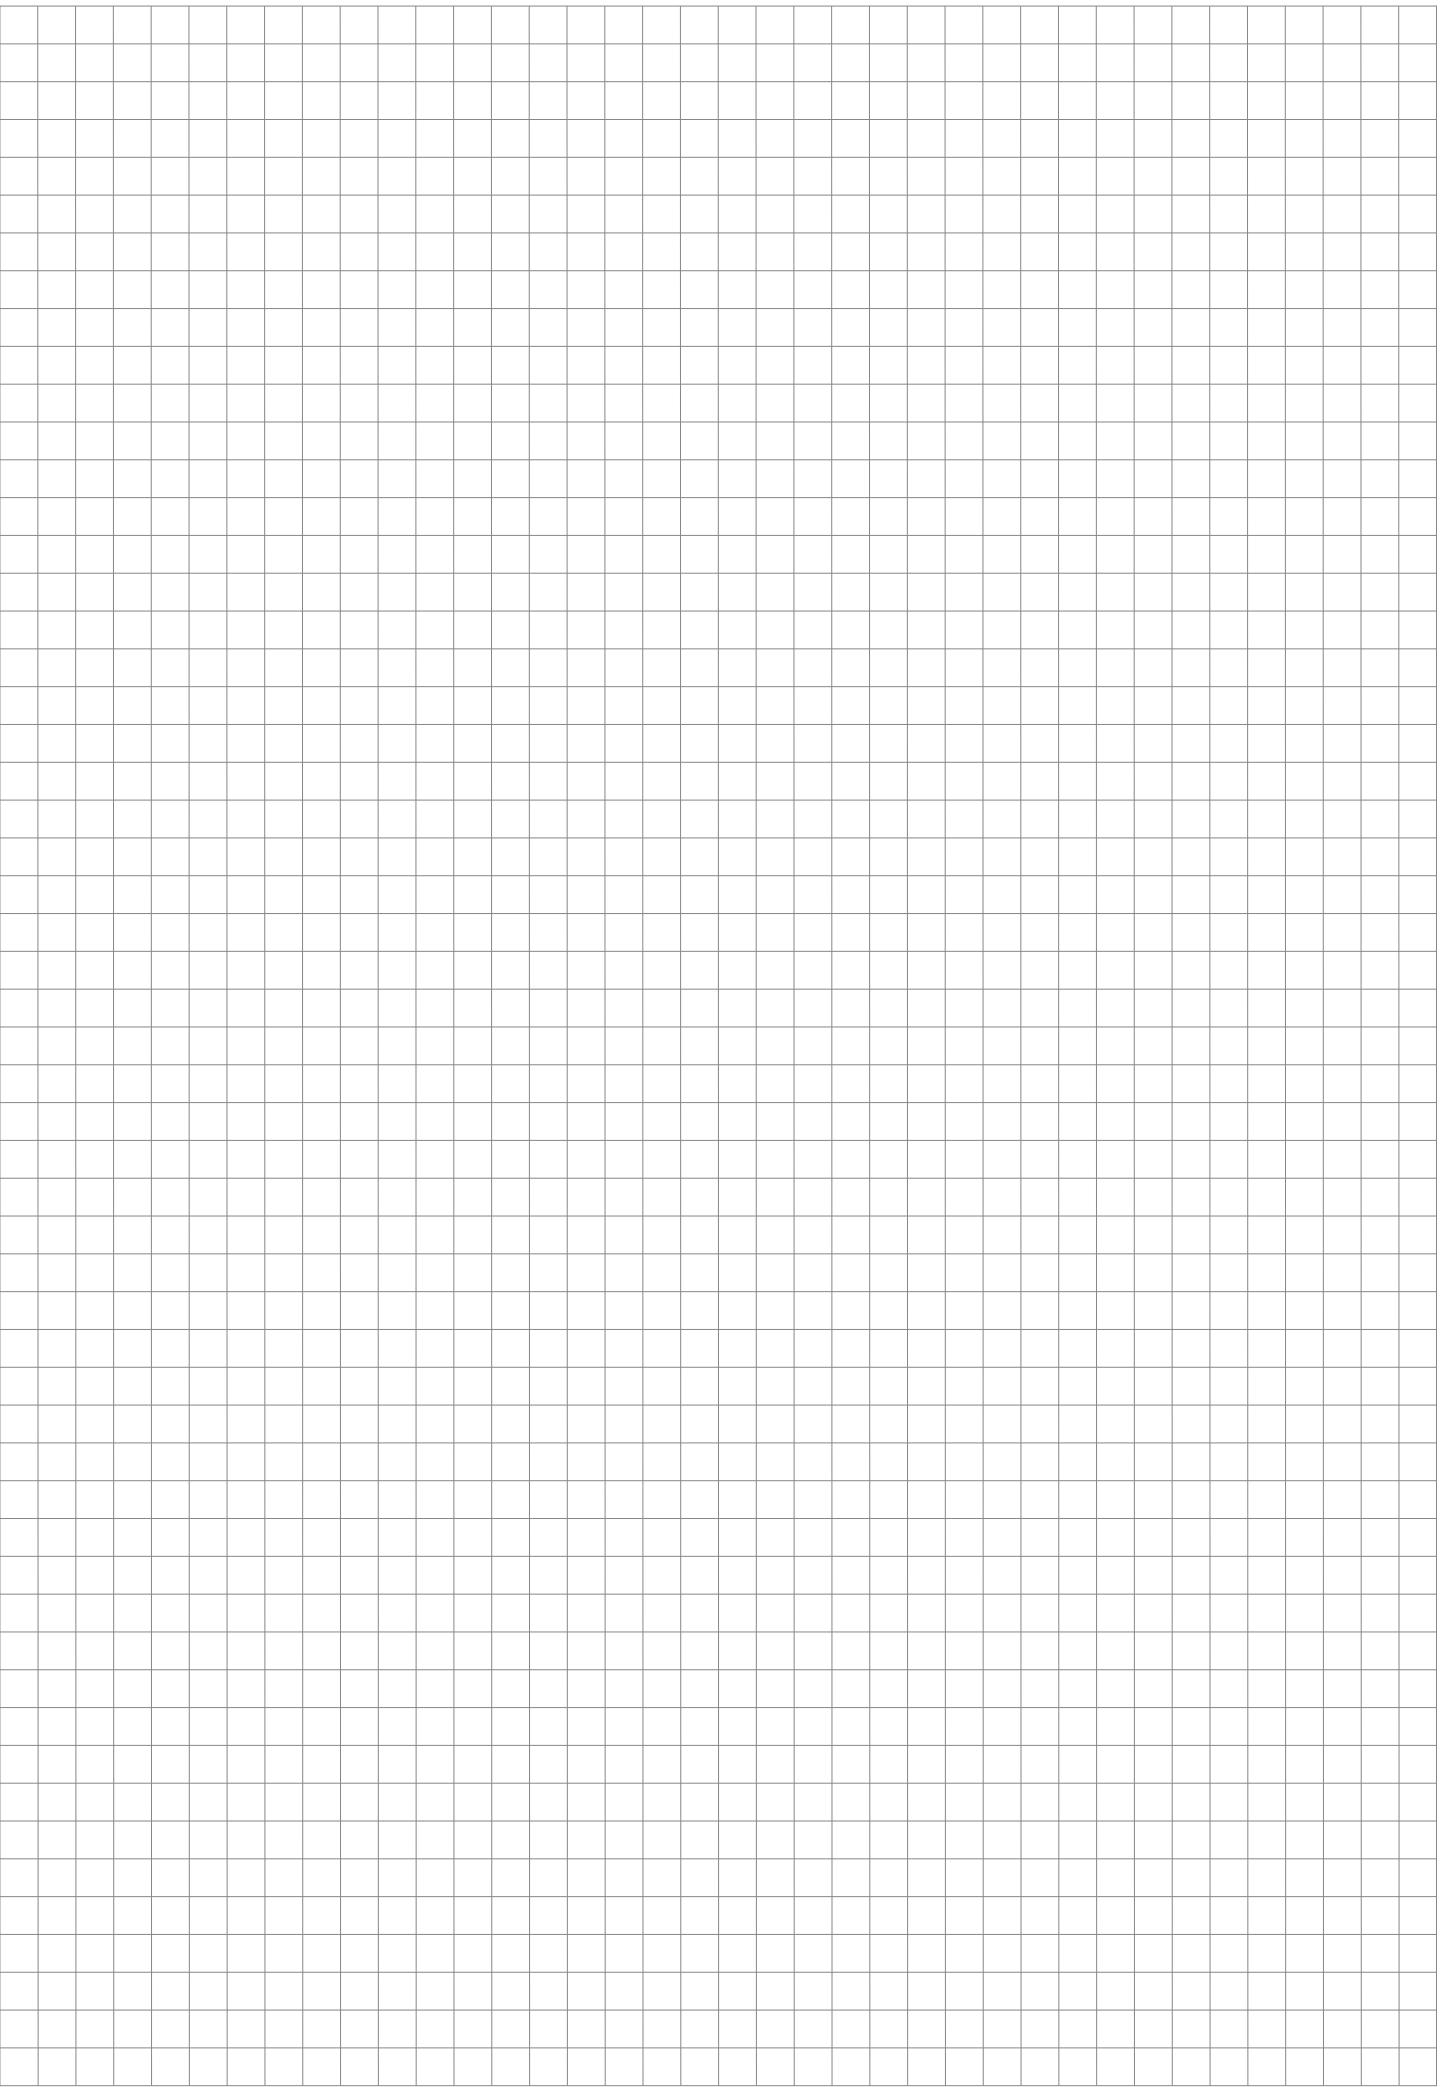

Alternatively available in 1.4571. This steel type is marked with **E4**.

Other materials of the same corrosion category available on request.

For special applications (light- and cable support constructions in car tunnels according to ZTV-ING) the high alloyed material No. 1.4529 is available.

Plastic Coating

For the use in zinc aggressive environments (pH index < 6 or > 12.5) or for indication through colours, zinc-coated construction parts can be coated with plastic on request (for example with epoxy or polyester).

Cable trays

The choice is made based on:

1. the number or volume of cables to be passed in a cable tray (load carrying capacity of the tray)
2. the distance between the support points of the tray (type of the tray)
3. the distance between the support points of the tray (load carrying capacity of the tray)

Re 1. Cable capacity/usable diameter

If the cable volume (type of cables, size, number) is not known, table 1 can help with the estimation: For cables of any size the volume needed is multiplied with the number of cables in order to determine the total sum. The result is the minimum cross section area of the cable tray needed, which may have to be extended by a standby factor). The regulations of the VDE 0100 regarding the load of cable trays must be observed in all cases.

Table 1: Space requirements for cables type NYY

Cable NYY	Diameter (mm)	Space per cable (app.)	Number of cables	
4x1.5	12.5	1.5 cm ²	x	=
4x2.5	14.0	1.8 cm ²	x	=
4x6	16.5	3.0 cm ²	x	=
4x16	22.0	5.0 cm ²	x	=
4x35	31.0	12.0 cm ²	x	=
4x70	41.0	16.0 cm ²	x	=
$A \geq \sum$				cm ²

(Source: EN ISO 12944-2)

The usable diameter area (A) of each cable tray is specified in the catalogue. If needed, several cable trays must be installed in parallel.

Re 2. Type of cable tray/weight of cable

If the total weight of the cables is unknown, table 2 can help with the estimation: For any cable size, the cable weight is multiplied by the number of cables to determine the total sum. The result is the estimated cable load (Q).

All specifications for carrying capacity listed in this catalogue relate to the respective product. The carrying capacity of the installed system depends on the actual configuration and specifically on the operational discharge of load into the structure.

Table 2: Weight of cables type NYY

Cable NYY	Weight of cable (app.)	Number of cables	
4x1.5	2.3 N/m	x	=
4x2.5	3.0 N/m	x	=
4x6.0	5.2 N/m	x	=
4x16	11.0 N/m	x	=
4x35	22.0 N/m	x	=
4x70	41.0 N/m	x	=
$Q = \sum$			N/m

With regard to security, the highest possible cable load is pivotal. It is calculated by multiplying the usable diameter by the specific cable weight*. The result (Q_{LK}) for each cable tray is listed in this catalogue.

* type of cable tray
cable ladder
cable tray
wire-mesh cable tray

Cable performance cable (Q_{LK})	specific cable weight 2.8 N/m pro cm ²
control cable (Q_{SK})	1.5 N/m pro cm ²

Re 3. Distance between supports (StA)

The recommended distance between supports is 1.5 meters. Nevertheless, the actual possible distance between supports can be considerably higher (up to 10 m), depending on available points of fastening (pillars, supporting structures).

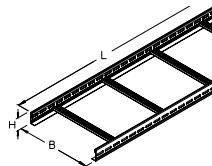

The capacity diagrams of the cable trays list the maximal load capacity (Q_{max}) a cable tray can carry securely with the given support distance.

Please observe the following calculation examples!

Choice of products

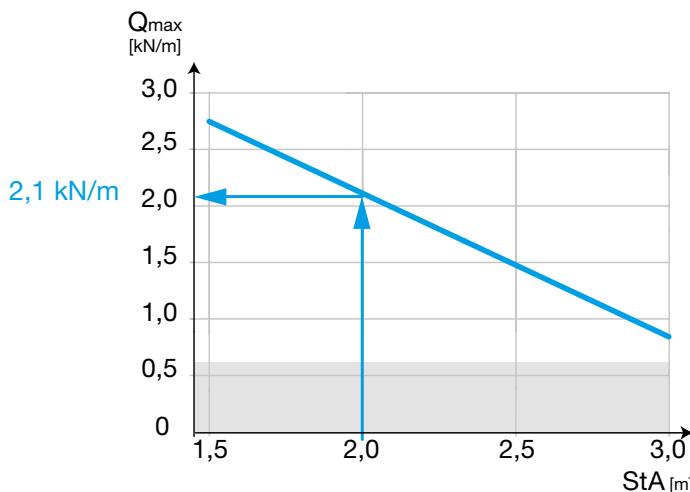

Technical information

How to determine the additional load based on the example LGG 60-40 with a support distance StA of 2,0 m

LGG 60 Cable ladder, height = 60 mm

Article number	H mm	B mm	L mm	A cm ²	Q _{sk} kN/m	G kg/m
S F E						
LGG 60-20	60	200	6000	81	0.23	2.64
LGG 60-30	60	300	6000	122	0.34	2.87
LGG 60-40	60	400	6000	162	0.45	3.10
LGG 60-50	60	500	6000	203	0.57	3.33
LGG 60-60	60	600	6000	243	0.68	3.56

The difference between the maximum load capacity and the possible cable load equals the highest permissible additional load:

$$\begin{aligned} Q_{\max} &= 2.10 \text{ kN/m} \\ Q_{LK} &= -0.45 \text{ kN/m} \\ \text{add. load} &= 1.65 \text{ kN/m} \end{aligned}$$

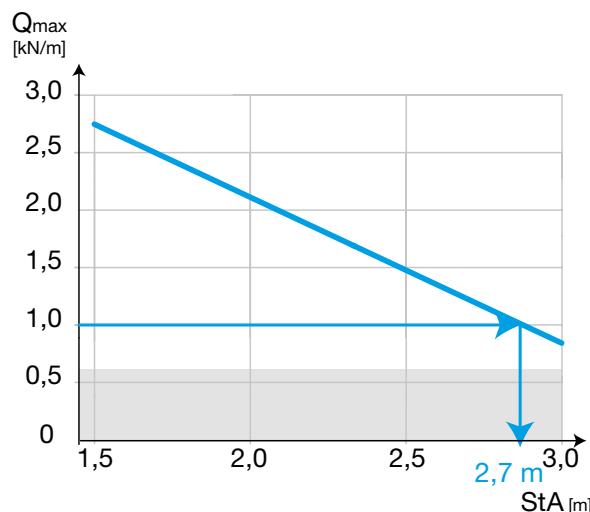

The cable tray load diagrams furthermore provide the maximum permissible support distance figures when the load is known.

How to determine the maximum support distance StA based on the example LGG 60-60:

LGG 60 Cable ladder, height = 60 mm

Article number	H mm	B mm	L mm	A cm ²	Q _{sk} kN/m	G kg/m
S F E						
LGG 60-20	60	200	6000	81	0.23	2.64
LGG 60-30	60	300	6000	122	0.34	2.87
LGG 60-40	60	400	6000	162	0.45	3.10
LGG 60-50	60	500	6000	203	0.57	3.33
LGG 60-60	60	600	6000	243	0.68	3.56

$$\begin{aligned} \text{Cable load} &= 0.68 \text{ kN/m} \\ \text{add. load} &= 0.40 \text{ kN/m} \\ Q_{\max} &= 1.08 \text{ kN/m} \end{aligned}$$

Maximum distance between supports is 2.7 meters.

The load capacity diagrams allow for a security reserve of at least 70% until possible failure (according to DIN EN 61537). Nevertheless cable trays may not be used for walking! If the maximum load capacity (Q_{\max}) or the maximum distance between supports of the selected cable tray is insufficient, types with a higher load capacity must be considered. If these do not meet the requirements either, a cable tray type with a higher load capacity must be chosen:

light ⇒ heavy:

Wire-mesh cable tray ⇒ cable tray ⇒ cable ladder ⇒ wide-span cable tray

Wide-span cable trays

are suitable for wide distances between supports. The load carrying capacity of such "cable bridges" primarily depends on the firmness and thus on the height of the side profiles. However, an increased side height also means an increased volume capacity and thus a higher maximum cable load.

This generally leads to the risk of unplanned overloads/overstress; therefore the wide-span cable trays offer the following solutions to said risk:

- an elevated cable tray bottom
- electrically welded connection of side rail and rung
- almost symmetric torsion-free side rail profiles
- at least 70% of security reserve in the load carrying capacity specifications* (see explanations EN 61537)

This information applies to all wide-span cable trays if side rail supports (WPHS) are mounted at the support point (bracket).

Cable trays may not be used for walking or as ladders. Wide-span cable trays may have a higher volume capacity than load carrying capacity depending on the distance between supports. Specifications on load carrying capacity based on the distance between supports need to be complied with.

Supporting structures

As a rule, supporting structures for the trace route contain on ceilings of steel bracket and ceiling bracket support (stem) and on walls of wall bracket or bracket support and stem bracket.

In order to select construction pieces of sufficient weight load ability, firstly the load of each cable tray at the support point must be determined:

Bracket load $P = (\text{cable load } Q + \text{weight of cable tray } w + \text{additional load}) \times \text{distance between supports StA}$

$$P = (Q + w) \times \text{StA}$$

1. Bracket (extension)

The load carrying capacity of the bracket (P_{\max}) must be higher than the above determined bracket load (P).

Please note that the load carrying capacity of the cable tray depends on the width of the selected cable tray (B_2). The load carrying capacity tables always presume the respective size of cable tray/bracket ($L \approx B_1 \approx B_2$).

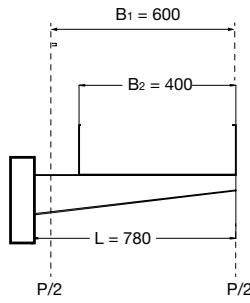

However, if the bracket is considerably longer and the cable tray is laid flush with the bracket tip, the following is valid by approximation: For example Konsole KWS 070 and cable ladder LGG 60-40:

KWS Wall bracket, heavy

Article number	B mm	L mm
F		
KWS 020	200	280
KWS 030	300	380
KWS 040	400	480
KWS 050	500	580
KWS 060	600	680
KWS 070	600	780

LGG 60 Cable ladder

Article number	H mm	B mm
S F E		
LGG 60-20	60	200
LGG 60-30	60	300
LGG 60-40	60	400
LGG 60-50	60	500
LGG 60-60	60	600

applies as follows:

$$P_{zul} \approx P_{\max} \left(\frac{L - \frac{B_1}{2}}{L - \frac{B_2}{2}} \right)$$

L = Length of the bracket

B_1 = verified width of the cable tray

(at $L \leq 580$ mm $B_1 \approx L$;

at $L > 580$ mm $B_1 = 600$ mm)

B_2 = selected width of the cable tray

The load carrying capacity specifications correspond to the values verified and certified according to EN 61537.

2. Ceiling bracket support (stem)

Ceiling bracket supports are stressed mainly by bending forces in case of one sided mounting of cable trays. Each individual bracket causes a so-called bending moment (M_i) in the stem which is determined by the bracket load (P_i) and overhang length (l_i) – ($M = P \times l_i$). The overhang length depends on the bracket length (L) and on the width of cable tray (B).

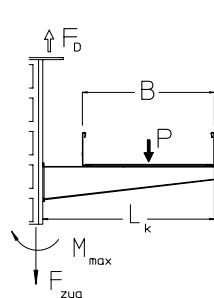

The sum of the individual bending moments (M_i) must not exceed the permissible moment (M_{max}). The M_{max} for every stem is specified in the catalogue.

If cable trays are mounted to both stem sides, the above said must apply to each of the two sides, since a one-sided equipment with cables (during the laying of cables) can usually not be excluded.

In order to simplify the choice of the suitable stem, the maximum bracket load (P_{max}) is specified for every cable tray width (B) with the corresponding bracket length (L_k).

If only one cable tray is to be fastened to the stem on one side (or only cable trays of equal width), the table determines directly whether $P \leq P_{max}$ (resp. $\sum P_i \leq P_{max}$) applies.

Example: KDI

$$L \leq 1000: M_{max} = 1600 \text{ Nm}$$

$$L > 1000: M_{max} = 2200 \text{ Nm} \quad F_zug = 20 \text{ kN}$$

KDI Bracket support, heavy, profile					
B mm	L _K mm	P _{max L>1000} kN	P _{max L<1000} kN	F _D /P	
100	120	20.0	14.5	1.3	
200	220	13.8	10.0	1.6	
300	320	10.5	7.6	1.9	
400	420	8.5	6.2	2.3	
500	520	7.1	5.2	2.6	
600	620	6.1	4.4	3.0	

Example: LGG 60-40

$$B = 400, \text{ stem length } < 1 \text{ m}$$

$$P_{max} = 6,2 \text{ kN}$$

If cable trays of different widths require a one-sided mounting to the stem, the share of the maximum load must be calculated for each individual cable tray width: $P_B/P_{B_{max}}$.

The sum of all these shares for the selected stem must be ≤ 1.0 :

$$\sum \frac{P_B}{P_{B_{max}}} < 1$$

Example: Two cable ladders, type LGG 60, have to be mounted single-sided to brackets on a ceiling bracket support.

The distance between the supports (StA) is 1.5 meters.

LGG 60 Cable ladder, height = 60 mm

Article number	H mm	B mm	L mm	A cm ²	Q _{SK} kN/m	G kg/m
S F E						
LGG 60-20	60	200	6000	81	0.23	2.64
LGG 60-30	60	300	6000	122	0.34	2.87
LGG 60-40	60	400	6000	162	0.45	3.10
LGG 60-50	60	500	6000	203	0.57	3.33
LGG 60-60	60	600	6000	243	0.68	3.56

KDU 60 Bracket support, heavy

B mm	L _K mm	P _{max L>1000} kN	P _{max L<1000} kN	F _D /P
100	120	19.3	12.5	1.2
200	220	12.9	8.3	1.5
300	320	9.7	6.2	1.9
400	420	7.7	5.0	2.2
500	520	6.4	4.2	2.6
600	620	5.5	3.6	2.9

Choice of products

Technical information

cable ladder width bracket length	B ₁ = 400 mm L ₁ = 420 mm	B ₂ = 600 mm L ₂ = 620 mm
cable load (based on catalogue):	Q _{LK} = 450 N/m	Q ₂ = 680 N/m
plus weight of cable ladder:	31 N/m	35,6 N/m
equals sum of load:	481 N/m	715,6 N/m

Sum of load multiplied by distance between supports	481 N/m x 1.5 m	715,6 N/m x 1.5 m
equals bracket load:	P ₁ = 721,5 N	P ₂ = 1.073,4 N

For bracket support KDU 60
(based on catalogue): P_{max 400} = 5.0 kN P_{max 600} = 3.6 kN

The sum of shares equals: $\sum \frac{P_B}{P_{B\ max}} = \frac{721.5\ N}{5,000\ N} + \frac{1.073.4\ N}{3,600\ N} = 0.44 (< 1)$

According to the above calculation, the selected bracket support may be used. However, if

$$\sum \frac{P_B}{P_{B\ max}} > 1$$

either a bracket support with a higher load capacity must be used or the support distance must be reduced.

The load capacity specifications correspond to the values verified and certified according to DIN EN 61537.

In the process of laying cables, high additional loads can occur. These additional loads may not be discharged into the cable support system.

Discharge of load into the construction piece

Technical information

All specifications for carrying capacity listed in this catalogue relate to the respective product. The carrying capacity of the installed system depends on the actual configuration and specifically on the operational discharge of load into the construction piece. In the process of laying cables, high additional loads can occur. These additional loads may not be discharged into the cable support system.

The following illustration can merely serve as additional support when applying dowel approvals; the approval specifications alone are binding.

Permissible dowel load F_{zul}

The vectorial overlay of various strength components effective at the anchorage point (e.g. shear force and vertical extraction force) yields the dowel load that must be lower /equal compared to the allowable dowel load listed in the approval (generally applies to all diagonal pull directions). The allowable dowel load depends on the anchorage ground material (concrete grade, brickwork stone type, etc.) as well as on its voltage load:

- cracked concrete tension zone
- verified concrete compression zone (e.g. concrete wall, support, the upper concrete beam half).

In cases of doubt, consult the responsible structural engineer.

Reduction

The allowable dowel load must be reduced,

- if several dowels have a smaller distance between each other than measure a (centre to centre distance).
- if the distance between the dowel and a structure edge or corner is smaller than measure ar (edge distance).

The factor for the calculation of the dowel load F_D is listed in the catalogue (applies to anchors with heavier loads).

Example: Ceiling bracket support

$$F_{D1} = \frac{P}{2} - P \cdot \frac{l}{a}$$
$$F_{D2} = \frac{P}{2} + P \cdot \frac{l}{a}$$
$$\rightarrow \frac{F_D}{P} = \frac{1}{2} + \frac{l}{a}$$

By a double-sided equipment of the bracket support the higher dowel load is always reduced.

Example: Wall bracket

$$F_{DV} = P$$
$$F_{DH} = P \cdot \frac{l}{h}$$
$$\rightarrow \frac{F_D}{P} = \sqrt{1 + (\frac{l}{h})^2}$$

When planning the route, please generally observe that the filling volume of the cable trays may exceed the carrying capacity of the cable trays. A sufficient extent of reserves must be included; if needed multi-layer reserves should be allowed for.

See the two examples from practice on the following pages!

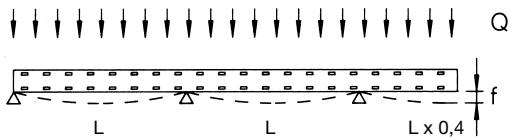

Cable support systems

Among other things, the DIN EN 61537 regulates the following. The procedure in which mechanical characteristics of cable support elements are to be tested.

To be tested are:

- a) Cable trays including connectors in specific configurations (end field, (without connector), middle field)

L = delivery length

The conditions do not correspond to those of the most advantageous continuous support applications.

- b) Brackets as single construction components, i. e. without the stiffening effect of mounted cable trays.

The load bearing capacity specifications are based on the measured loads at a still permissible level of deformation (f_{zul}) of the test samples. Cable support elements in the particular standard version (Sendzimir/hot dip galvanized) were tested.

Cable trays

were tested under a specially developed testing condition ensuring that components which bend elastically under loads are strained evenly across the surface.

$$f_{zul} \text{ (longitudinal direction)} = 0.01 \times \text{support spacing}$$

$$f_{zul} \text{ (transverse direction)} = 0.05 \times \text{cable tray width},$$

Arms/brackets

Under a vertical load the tips of the arms may lower by:

$$f_{zul} = 0.05 \times \text{arm length} \text{ (however } \leq 30 \text{ mm)}$$

Studs (bracket holders)

- a) Studs are bent by the effects of sideway forces; the permitted offset is:

$$f_{zul} = 0.05 \times \text{stud length}$$

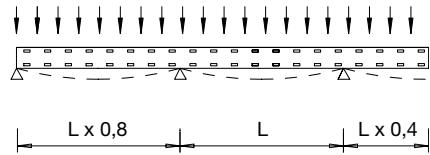

- b) tested in combination with beams under force effect,
- c) pulled by a centric load.

In each case the highest stud length was tested.

Safety

The tested elements must withstand a load that exceeds its permissible level by at least 70%. Possible failures are not equivalent to the breakage of the component (total failure) but rather consist of a deformation, significant enough that no further increase of load bearing capacity can be registered (hammock). Consequentially, cable support elements made of metal that indicates its load condition (including overloading) by deformation are preferable to spontaneously breaking support systems made of plastic.

Wide-span systems are tested differently as follows:

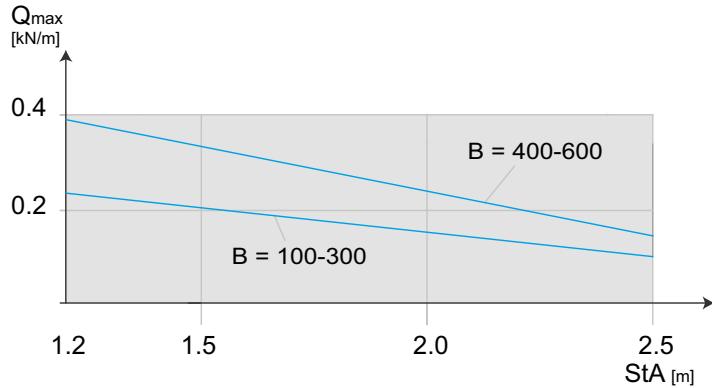

according to IEC 61537 (DIN EN 61537) 10.3.2 testing method II

DIN EN 61537 | Equipotential Bonding

Technical information

When planning the route, please generally observe that the filling volume of the cable trays may exceed the carrying capacity of the cable trays. A sufficient extent of reserves must be included; if needed multi-layer reserves should be allowed for.

Example wire tray G 50:

Q_{sk} Cable load based on filling volume A at maximum width B

Equipotential bonding

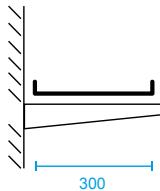

Cable ladders and cable trays are mounted with screw connections. The equipotential bonding is certified according to DIN EN 61537.

Example wall bracket

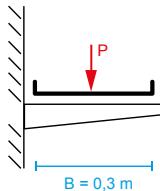

How to choose the right cable support system?

How to choose the right cable support system?

From the tender: cable tray perforated **B** = 300 mm, **H** = 60 mm, doweled to a concrete wall with a support distance **StA** = 1.5 m.

1. Selecting the cable tray

Specification: Cable tray with a height of 60 mm and a width of 300 mm, resulting in: **RG 60-30S**. In order to calculate the bracket load **P**, the cable load **Q_{sk}** = ? must be determined first.

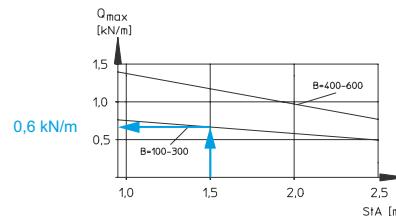

2. Determining the cable load Q_{sk}

RG 60 Cable tray, height = 60 mm

Article number	H mm	B mm	A cm ²	Q _{sk} kN/m	G kg/m
S					
RG 60-10	60	100	56	0.09	1.5
RG 60-20	60	200	113	0.17	1.93
RG 60-30	60	300	171	0.26	2.5
RG 60-40	60	400	228	0.34	3.57

The maximum cable load with regard to the loading capacity of cable trays is **Q_{sk}** = 0.26 kN/m.

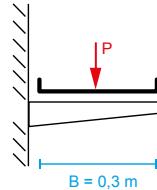

3. Determining the bearing capacity

With its 0.6 kN/m, the verified bearing capacity is significantly above the possible loading capacity of 0.26 kN/m.

$$Q_{\max} \text{ } 0,6 \text{ kN/m} > Q_{sk} \text{ } 0,26 \text{ kN/m} \checkmark$$

4. Determining the bracket load P

The bracket load **P** is determined by the cable load **Q_{sk}** multiplied by the support distance **StA** (1.5 m from price list)

$$P = Q_{sk} \times StA$$

$$P = 0.26 \text{ (kN/m)} \times 1.50 \text{ (m)} = 0.39 \text{ kN}$$

5. Dimensioning the wall bracket

KW Wall bracket, standard

Article number	H mm	B mm	L mm	P _{max} kN	F _D /P	G kg
F						
KW 010	34	100	120	1.4	3.1	0.13
KW 015	34	150	170	1.4	4.1	0.16
KW 020	56	200	220	2.0	3.0	0.35
KW 030	56	300	320	2.0	4.0	0.50
KW 040	75	400	420	2.4	3.6	0.80

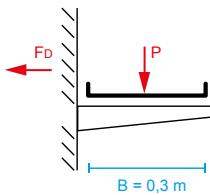

Calculated bracket load **P** = 0,39 kN, verified bracket load **P_{max}** for **KW 030F** = 2,0 kN.

$$P_{\max} = 2,0 \text{ kN} > P = 0,39 \text{ kN} \checkmark$$

Example wall bracket

How to choose the right cable support system?

6. Determining the dowel extraction force

The dowel extraction force F_d is determined based on statics and dowel approval for $B = 300 \text{ mm}$.

7. Ratio dowel extraction force F_d to bracket load P

KW Wall bracket, standard

Article number	H mm	B mm	L mm	P_{\max} kN	F_d/P	G kg
F						
KW 010	34	100	120	1.4	3.1	0.13
KW 015	34	150	170	1.4	4.1	0.16
KW 020	56	200	220	2.0	3.0	0.35
KW 030	56	300	320	2.0	4.0	0.50
KW 040	75	400	420	2.4	3.6	0.80

With bracket load $P = 0.39 \text{ kN}$, the dowel extraction force F_d is calculated as follows:

$$F_d/P = 4.0 \Rightarrow F_d = P \times 4.0 \\ F_d = 0.39 \text{ (kN)} \times 4.0 = 1.56 \text{ kN}$$

8. Choice of dowel

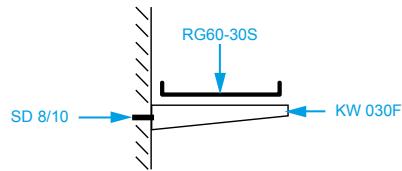

SD Straddling dowel

Article number	\emptyset mm	D mm	t mm	P_{zul} kN	L_{min} mm	G kg/100
GV						
SD 8/10	8	8	0 - 10	2.4	55	3.5
SD 8/30	8	8	0 - 30	2.4	55	4.4
SD 10/10	10	10	0 - 10	4.3	75	6.2

For **SD 8/10**, the dowel approval results in a permissible dowel extraction force in cracked concrete of **2.4 kN**. The calculated dowel extraction force is **1.56 kN**.

Pzul 2,40 kN > FD 1,56 kN ✓

Result of the dimensioned support system

From the tender:

perforated cable tray $B = 300 \text{ mm}$, $H = 60 \text{ mm}$, support distance $StA = 1.5 \text{ m}$

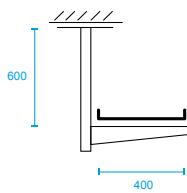

Result

- cable tray type **RG 60-30S**
- wall bracket type **KW 030F**
- dowel type **SD 8/10**

Example stem bracket

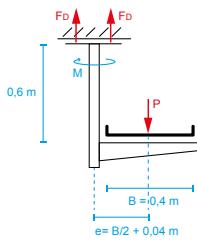

How to choose the right cable support system?

How to choose the right cable support system

From the tender: cable tray perforated **B** = 400 mm, **H** = 60 mm, doweled 600 mm below concrete ceiling with a support distance **StA** = 1.5 m.

1. Selecting the cable tray

Specification: Cable tray with a height of 60 mm and a width of 400 mm, resulting in:
RG 60-40S

In order to calculate **P**, the cable load **Q_sk** = ? must be determined first.

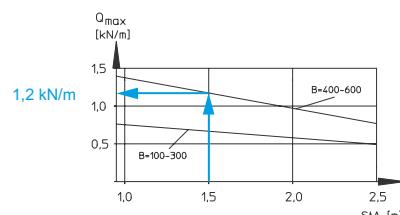

2. Determining the cable load **Q_sk**

RG 60 Cable tray, height= 60 mm

Article number	H mm	B mm	A cm ²	Q _{sk} kN/m	G kg/m
S					
RG 60-10	60	100	56	0.09	1.5
RG 60-20	60	200	113	0.17	1.93
RG 60-30	60	300	171	0.26	2.5
RG 60-40	60	400	228	0.34	3.57

The maximum cable load with regard to the loading capacity of cable trays is **Q_sk** = 0.34 kN/m.

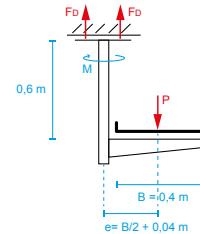

3. Determining the bearing capacity

At 1.2 kN/m, the verified bearing capacity with **StA** = 1.5 m is significantly above the possible loading capacity of 0.34 kN/m.

Q_{max} 1,2 kN/m > **Q_{sk}** 0,34 kN/m ✓

4. Determining the bracket load **P**

The bracket load **P** is determined by the cable load **Q_{sk}** multiplied by the support distance **StA** (1.5 m from price list)

$$P = Q_{sk} \times StA$$

$$P = 0.34 \text{ (kN/m)} \times 1.50 \text{ (m)} = 0.51 \text{ kN}$$

5. Dimensioning the stem bracket

KW Bracket, standard

Article number	H mm	B mm	L mm	P _{max} kN	F _D /P	G kg
F						
KW 010	34	100	120	1.4	3.1	0.13
KW 015	34	150	170	1.4	4.1	0.16
KW 020	56	200	220	2.0	3.0	0.35
KW 030	56	300	320	2.0	4.0	0.50
KW 040	75	400	420	2.4	3.6	0.80
KW 050	96	500	520	2.1	3.4	1.40
KW 060	96	600	620	2.1	4.0	1.60

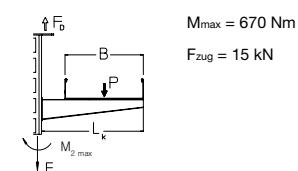

Calculated bracket load **P** = 0.51 kN, verified bracket load **P_{max}** for **KW 040 F** = 2.4 kN

P_{max} = 2,4 kN > **P** = 0,51 kN ✓

6. Dimensioning the ceiling stem

KDU 57 Bracket support, 57x30 mm

B mm	L _k mm	P _{max} kN	F _D /P
100	120	6.9	1.4
200	220	4.5	1.9
300	320	3.4	2.3
400	420	2.7	2.8
500	520	2.2	3.2
600	620	1.9	3.7

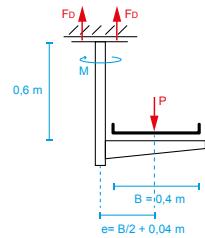

P_{max} = 2,7 kN > **P** = 0,51 kN ✓

Example stem bracket

How to choose the right cable support system?

7. Determining the dowel extraction force

The dowel extraction force F_d is determined based on statics and dowel approval for $B = 400$ mm.

8. Dowel calculation

KDU 57 Bracket support, 57x30 mm

B mm	L _k mm	P _{max} kN	F _d /P
100	120	6.9	1.4
200	220	4.5	1.9
300	320	3.4	2.3
400	420	2.7	2.8
500	520	2.2	3.2
600	620	1.9	3.7

Using bracket load $P = 0.51$ kN, the dowel extraction force F_d is calculated as follows:

$$F_d/P = 2.8 \Rightarrow F_d = P \times 2.8 \\ F_d = 0.51 \text{ (kN)} \times 2.8 = 1.428 \text{ kN}$$

9. Choice of dowel

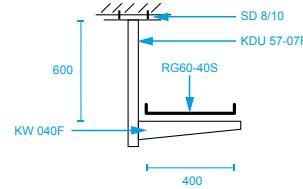

SD Straddling dowel

Article number	Ø mm	D mm	t mm	P _{zul} kN	L _{min} mm	G kg/100
GV						
SD 8/10	8	8	0 - 10	2.4	55	3.5
SD 8/30	8	8	0 - 30	2.4	55	4.4
SD 10/10	10	10	0 - 10	4.3	75	6.2

For **SD 8/10**, the dowel approval results in a permissible dowel extraction force in cracked concrete of **2.4 kN**.

2,40 kN > 1,428 kN ✓

Result of the dimensioned support system

From the tender

Perforated cable tray $B = 400$ mm, $H = 60$ mm, doweled 600 mm below concrete ceiling, support distance $STA = 1.5$ m

- cable tray type **RG 60-40S**
- stem bracket type **KW 040F**
- ceiling stem type **KDU 57-07F**
- dowel type **SD 8/10**

Single-spam girder with centric single load

Technical informationen

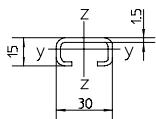

The values in the table are valid for hot-dip galvanised profiles with a centric force application F, allowing for the maximum permissible tension σ_{zul} , respectively the maximum permissible deflexion f (L/100).

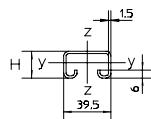

The values include a safety factor of 1.35 against failure load.

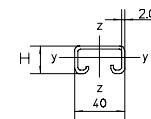

Maximum load F_{max} [N] and the corresponding deflection f [mm]
